How Cloud Telephony Is Changing The Way We Do Business?

This ultimate guide is designed to help you understand why you need your business to shift to Cloud Telephony.

By My-VoIP

Introduction

Although the world has steadily shifted to emails and other types of electronic communication, one old actor - the telephone - continues to play an important role in the commercial communication cycle. Telephony is one of the oldest, yet most powerful mediums for communicating with others.

Technology is growing with every passing day, and so is the need for a much more personalized customer experience. The advent of smartphones and tablets has given today's customers the power to stay more connected with the business.

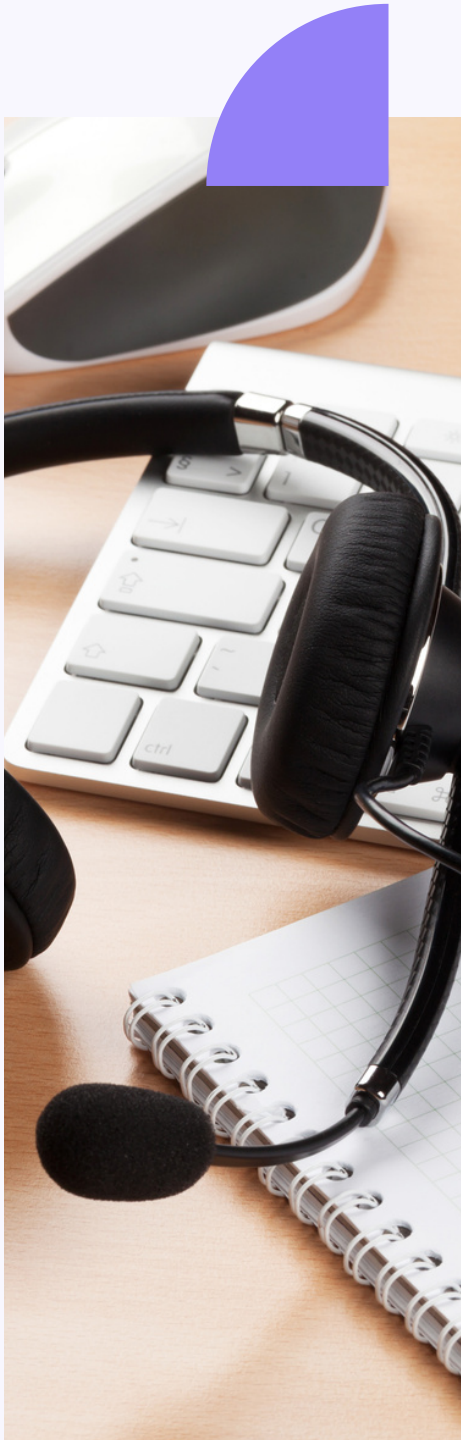
When it comes to contacting businesses, telephones are still considered an important business tool. In fact, according to a recent report, 91 percent of senior managers in Fortune 1000 companies consider the telephone to be an essential communications channel in their organization. This gives telephony the strongest importance index among all the available channels.

What began as a basic way to connect people has evolved into one of the most widely used technologies of our time. As technology progresses, so does the desire for a considerably more personalized customer experience. Because of the development of smartphones and tablets, customers can now stay more involved with businesses.

In the present day scenario where businesses are focused on exploring newer developments and efficiencies, cloud telephony emerges as a viable option for companies to upgrade their traditional office phone system. In the acute competition, businesses need to grow bigger and faster and must go beyond what is offered by a traditional telephone system.

With cloud telephony, businesses have an opportunity to expand their reach and attract a wider range of clients through targeted business calling features. Cloud telephony is the leading solution that replaces the traditional PBX phone system. The traditional PBX phone system has limitations in its features. To compensate for the requirements of any growing business, cloud telephony is introduced in the communication industry.

The traditional PBX phone system is expensive and complicated to maintain, while at the same time being very limited in functionality. Cloud telephony offers enterprises with scalable and dependable access to unified corporate communication without the need for infrastructure or CAPEX investments.



02.

Why is Cloud Telephony Better Than a PBX?

Because cloud-based voice is a cloud-based solution, you can choose only what you want and need. No more using multiple vendors. No more worries about how you'll keep up with new technologies or whether or not your phone system will integrate with the rest of your business applications.

With a virtual PBX, you can add extensions and services on-demand when you need them. Best of all, it's controlled from a single location—the cloud (search for this term and you will be directed to the company's support area).

When is a Good Time to Consider the Cloud?

It is not surprising that most businesses which relied on telephony solutions realized that they needed to look for alternatives. The need to find a solution was brought about by the following:

- The costs associated with maintaining an existing system which had proven to be inefficient and problematic.
- The fact that most businesses were experiencing trouble with telephony solutions because of the limited features associated with such systems.
- The need to reduce the time spent on training employees how to use and maintain the system as well as deal with emergencies related to it.
- Problems with network bottlenecks
- The difficulty in finding a scalable and reliable replacement as needed due to the overall cost of telephony solutions.

Reduce Costs. Improve Communication.

According to a new Gartner study, cloud strategy enables firms to manage their communication operations more quickly, agilely, and creatively.

Of the organizations using cloud services, **more than 75%** indicate they have a cloud-first strategy.

Cloud telephony has transformed the entire organizational communication cycle. Companies looking for cloud telephony solutions are largely motivated by the need to reduce operational costs while improving productivity and customer service.

01.

Initial Financial Commitment

The setup and maintenance of an on-premise communication system utilizing a standard PBX system necessitates an initial financial commitment.

This covers software licensing, routers, networking, and a range of additional considerations based on your current business communication needs.

02.

Yearly Maintenance Costs

Upgrades, hardware maintenance, technical support, and troubleshooting often cost between 17 and 22 percent of a customer's software licensing charge. Growing business demands necessitate additional "customizations" in the current communication system, which might result in greater maintenance costs.

With profit margins of up to 90%, it's no wonder that support and maintenance charges are often the cash cow for the bulk of these conventional third-party vendors.

03.

Scalability

One of the most fundamental universal benefits of cloud-based communication platforms is scalability. There will be possibilities to enhance your business communication process as your firm grows. This is not the case with the current typical PBX system.

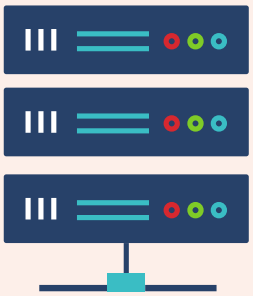
When you add or delete new lines in on-premise systems, your existing infrastructure may be disrupted in order to accommodate the new growth. Maintenance and repair will be significantly more complex and time-consuming if your PBX has been in existence for a decade or more.

Why Consider a Hosted Cloud-Based Solution?

Cost savings through the use of cloud telephony are obvious. Long-term savings are considerable. And with features readily available, businesses are given access to call recording, security features, presence reporting, auto attendants, interactive voicemail and more!

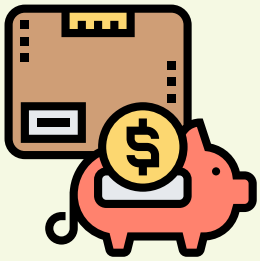
High Availability & Uptime

A hosted cloud-based PBX (Private Branch eXchange) solution ensures thorough connectivity, guaranteeing your infrastructure 24x7 availability, as much as 99.96%.



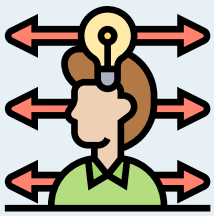
It's Cheaper

Cloud telephony aids in reducing costs at multiple levels. You pay for what you use, unlike with a traditional PBX system, and the cost of adding lines is relatively less as compared to a traditional system



It's Flexible and Scalable

The cloud platform offers a lot of flexibility and scalability. A user can easily add or remove extensions and features such as automated IVR calling, sticky agents, call queuing, etc.

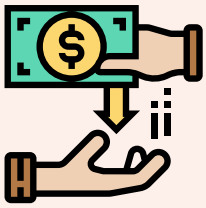


Disaster Recovery

In today's world, it is essential to ensure that your IT infrastructure can support all company requirements and specifically manage the business continuity requirement. Hosted PBX systems do not provide you with disaster recovery whereas when you use a cloud-based telephony solution, you are part of a system that has disaster recovery and ensures business continuity throughout.

Pay as you Go

A hosted cloud solution, on the other hand, has an upfront fee. Aside from a tiny startup fee, the rest of the pricing is straightforward and depends on what you use and the services you use. There are no additional charges!



What Are The Most Important Features of a Cloud-Based Solution?

.1 Call Reporting and Recording

.2 Voicemail

.3 API Integrations

.4 Call Queuing

.5 Intelligent Sticky Agent

.6 Cloud-Based Call Analytics

We Connect. You Succeed.

Connect with your customers by providing them with reliable phone solutions, VOIP technology and superior customer service. My VoIP has the right plan and features to meet your business needs and budget.
